SmartCareRx™ allows organizations to electronically prescribe medications seamlessly from within the platform to any Surescripts participating pharmacy, improving efficiency and helping to reduce the possibility of prescription errors.

## Key Benefits

Ease and convenience of electronic prescribing vs paper scripts.

Easy access to patient and medication details, including current diagnosis, medications, and known allergies.

Full integration into the SmartCare™ platform and clinical care management function, so prescriptions are seamlessly integrated into the treatment plan.

## Key Functions

SmartCareRx™ functionality includes prescribing, modifying, refilling, alerting for filled medications, capturing medication consents, and submissions to any pharmacy on the Surescripts network. If the need arises to send to a pharmacy not on the Surescripts network, scripts can be printed.

With SmartCareRx™, it's easy for prescribers to order and refill prescriptions and to stay up-to-date with prescriptions and patient information. The SmartCareRx™ dashboard provides easy access to the patient and medication details, patient consent and their order history, current diagnosis and medications, and known allergies.

SmartCareRx™ is powered by First Databank. All medications, formularies, strengths, and contraindications are based on current standards and maintained accordingly. It also supports Electronic Prescribing of Controlled Substance (EPCS).

Because SmartCareRx™ is fully integrated into the SmartCare™ platform, it is also integrated into the care/treatment plan, and medications can be prescribed from and tracked within the plan itself. Any prescription-related information is also available for reporting and analysis via SmartCare's robust and integrated analytics tools.
